

Dear Sir/Madam.

Option 3 is the one that I think is best because it would provide an insight into a place that we know so very little about.

Titan is the ultimate destination as it is the weirdest and most wonderful moon I ever heard about. It is a beautiful place. A grand oasis of things that are normally unimaginable floating about in space. Although it is dwarfed by Saturn it still shines away for me and radiantly has put its place in my heart.

Titan is somewhere that is big, black and surrounds it on all sides (except for Saturn that surrounds quite a lot of it! Not to mention the rings as well), an unknown place but very little is known about it, it is really interesting and I have read just enough for me to understand just what it is all about. Space really interests me and all the things in it and I would really like to learn more about it and this will give me a chance to understand more.

Titan really interests me as it has seas of methane and this gas is more usually found in the gases that emerge from both ends of a cow (I guess that it is the ultimate moo moon!) it's thick orange atmosphere and the way it and the other moons cut holes in the rings around Saturn with their gravity is amazing and I would very much like to know more about it.

I would really like to win this because I usually have really bad luck but I don't mind that much, I'm used to it!

So point away NASA I'll be watching!

Thank you for your time reading this letter, and I hoped you enjoyed it!
